The University of New Mexico IEEE Student Branch

Outline

- What is Deep Learning
- Deep Learning Examples
- Neural Networks
  - MNIST Demo
- Convolutional Neural Networks
  - Fashion MNIST Demo

AI vs. ML vs. DL

Artificial Intelligence

Computing systems mimicking Human behavior

Machine Learning

Learning (improving) without being explicitly programmed

SVM, Logistic Regression, Decision Tree, Linear Regression

Deep Learning

Learning representations directly from data using neural networks

CNN, GAN, RNN,

ML vs DL

Machine Learning
Input
Feature extraction
Classification
Car
Not Car
Output
Deep Learning
Input
Feature extraction + Classification
Car
Not Car
Output

Deep Learning Example – Computer Vision

Deep Learning Example – Speech Recognition

Deep Learning Example – NLP

Deep Learning Example – Machine Translation

Deep Learning Example – Game Play

Deep Learning Example – Self-driving cars

Why Deep Learning Now – Big Data

Why Deep Learning Now - Hardware

Why Deep Learning Now - Software

Keras

fast.ai

mxnet

TensorFlow

PYTORCH

NVIDIA

A Learning Example

$$\hat{y} = b + Wx$$

$$J(W, b\,) = \frac{1}{2m}\sum_{i=1}^{m}\left((b + Wx) - y^{i}\right)^{2}$$

$$\underset{W,b}{\text{minimize}}\ J(W, b\,)$$

repeat until convergence {

$$b \coloneqq b\ - \alpha \frac{\partial}{\partial b} J(W, b\,)$$

$$\mathrm{W} \coloneqq W - \alpha \frac{\partial}{\partial W} J(W, b\,)$$

}

Deep Learning – Early Inspiration

Biological Neuron

Artificial Neuron

$$z = \sum_j W_j x_j + b$$

$$\hat{y} = \frac{1}{1+e^{-z}}$$

Inputs | Parameters/ Weights | Sum | Non-linearity | Output

Training a Artificial Neuron

$$z = \sum_j W_j x_j + b$$

$$\hat{y} = \frac{1}{1 + e^{-z}}$$

$$J(W, b) = -\frac{1}{m}[\sum_{i=1}^{m} y^i \log(\widehat{y^i}) + (1 - y^i \log(1 - \widehat{y^i})]$$

$$\underset{W,b}{\text{minimize}}\ J(W, b\ )$$

repeat until convergence {

$$b := b\ - \alpha \frac{\partial}{\partial b} J(W, b\ )$$

$$\mathrm{W_j} := W_j - \alpha \frac{\partial}{\partial W_j} J(W, b\ )$$

}

Deep Learning – Fully Connected Network

Neural Network Example - MNIST

- Recognize Hard Written Digits (28x28 grey scale)
  - 60,000 training images
  - 10,000 testing images

MNIST Data

label = 5

Training a Neural Network

Forward Propagate Data to calculate Loss

Back Propagate the Loss to calculate Gradient

Intro to Keras

- High-level neural network library
- Written in Python
- Sits on top of Tensorflow
- Allows for quick prototyping
- Run seamlessly on CPU, GPU or TPU

Demo – Train Neural Network

- MNIST Data
- Keras
- Running on Google Colab (GPU K80)
  - https://colab.research.google.com (free)
  - https://colab.research.google.com/drive/1Ys-wm7uY5ZUYsAWsCr8NnlLAUbR7Arej

Demo - Load libraries and data

```
import tensorflow as tf
import matplotlib.pyplot as plt
import numpy as np

mnist = tf.keras.datasets.mnist #28x28 images

(x_train, y_train), (x_test, y_test) = mnist.load_data()
```

Demo – Normalize data

```
x_train = tf.keras.utils.normalize(x_train,axis=1)
x_test = tf.keras.utils.normalize(x_test,axis=1)
```

Now each data input ranges from 0 to 1 instead of 0 to 255

Demo - Construct the Neural Network

```
model = tf.keras.models.Sequential()
model.add(tf.keras.layers.Flatten())
model.add(tf.keras.layers.Dense(128, activation=tf.nn.relu))
model.add(tf.keras.layers.Dense(128, activation=tf.nn.relu))
model.add(tf.keras.layers.Dense(10, activation=tf.nn.softmax))

model.compile(optimizer='adam', loss='sparse_categorical_crossentropy', metrics=['accuracy'])
```

Demo - Train and Test the Neural Network

```
model.fit(x_train,y_train, epochs=5)
```

```
Epoch 1/5
60000/60000 [==============================] - 11s 186us/step - loss: 0.2665 - acc: 0.9229
Epoch 2/5
60000/60000 [==============================] - 9s 157us/step - loss: 0.1088 - acc: 0.9667
Epoch 3/5
60000/60000 [==============================] - 10s 160us/step - loss: 0.0727 - acc: 0.9769
Epoch 4/5
60000/60000 [==============================] - 10s 158us/step - loss: 0.0532 - acc: 0.9830
Epoch 5/5
60000/60000 [==============================] - 9s 158us/step - loss: 0.0402 - acc: 0.9865
<tensorflow.python.keras.callbacks.History at 0x7fded32dae48>
```

```
val_loss, val_acc = model.evaluate(x_test,y_test)
```

```
10000/10000 [==============================] - 1s 72us/step
```

```
print(val_loss, val_acc)
```

```
0.09539085898089689 0.9724
```

Demo – Train Convolutional Neural Network

- Fashion MNIST Data
- Keras
- Running on Google Colab (GPU TPU)
  - https://colab.research.google.com (free)
  - https://colab.research.google.com/drive/1kQWS89EnID2eqpm68dS0dhuNUW_nbp8Z

Demo – Load libraries

```
import tensorflow as tf
import numpy as np
import matplotlib.pyplot as plt
import os

from tensorflow import keras
from tensorflow.keras.models import Sequential
from tensorflow.keras.layers import Dense, Flatten, Conv2D, MaxPooling2D

from tensorflow.keras.utils import to_categorical
import tensorflow.keras.datasets.fashion_mnist as ds
```

Demo – Load data

```
(train_images, train_labels),(test_images, test_labels) = ds.load_data()

train_images = train_images.reshape((60000, 28, 28, 1))
train_images = train_images.astype('float32') / 255

test_images = test_images.reshape((10000, 28, 28, 1))
test_images = test_images.astype('float32') / 255

train_labels = to_categorical(train_labels)
test_labels = to_categorical(test_labels)
```

Demo – Construct the CNN

```
model = Sequential()
model.add(Conv2D(32, (3, 3), activation='relu', input_shape=(28, 28, 1)))
model.add(MaxPooling2D((2, 2)))
model.add(Conv2D(64, (3, 3), activation='relu'))
model.add(MaxPooling2D((2, 2)))
model.add(Conv2D(64, (3, 3), activation='relu'))

model.add(Flatten())
model.add(Dense(64, activation='relu'))
model.add(Dense(10, activation='softmax'))
```

```
model.compile(optimizer='rmsprop',
              loss='categorical_crossentropy',
              metrics=['accuracy'])
```

Demo – Setup the TPU instance

```
TPU_WORKER = 'grpc://' + os.environ['COLAB_TPU_ADDR']
tf.logging.set_verbosity(tf.logging.ERROR)

tpu_model = tf.contrib.tpu.keras_to_tpu_model(
    model,
    strategy=tf.contrib.tpu.TPUDistributionStrategy(
        tf.contrib.cluster_resolver.TPUClusterResolver(TPU_WORKER)))
```

Demo – Train

```
history = tpu_model.fit(train_images, train_labels,
                        epochs=20,
                        batch_size=128 * 8)
```

```
Epoch 1/20
60000/60000 [==============================] - 11s 186us/step - loss: 1.1575 - acc: 0.5836
Epoch 2/20
60000/60000 [==============================] - 1s 22us/step - loss: 0.7061 - acc: 0.7379
Epoch 3/20
60000/60000 [==============================] - 1s 22us/step - loss: 0.5649 - acc: 0.7875
Epoch 4/20
60000/60000 [==============================] - 1s 24us/step - loss: 0.4991 - acc: 0.8145
Epoch 5/20
60000/60000 [==============================] - 2s 25us/step - loss: 0.4503 - acc: 0.8355
```

Demo – Evaluate

```
tpu_model.evaluate(test_images, test_labels, batch_size=128 * 8)
```

```
10000/10000 [==============================] - 4s 389us/step
[0.28891048345565795, 0.8972999990463257]
```
